

A New Non-Surgical Answer to Excess Fat under the Chin!

Submental fullness, commonly known as “double chin” or “turkey neck”, affects both men and women. While sometimes caused by weight gain, other factors such as genetics and aging may also contribute. When this is the case, the condition may not go away despite exercise or diet.

KYBELLA® (deoxycholic acid) is the first FDA-approved, non-surgical treatment for adults with submental fullness and is now being offered by Dr. Bird. This injectable treatment works

by permanently destroying the fat cells under the chin, improving your appearance and profile. The process takes under 20 minutes and you can go back to your normal activities with NO downtime, unlike a surgical neck lift or chin liposuction.

Special introductory pricing is now available! Schedule by end-of-day December 1st, mention this newsletter and you'll receive \$200 off this

exciting new treatment. To see if you are a candidate, call to schedule a consultation.
